In order to prepare the campus water infrastructure to deliver recycled water for irrigation, FD&O has hired a contractor to work on underground piping at the locations shown on this map.

The contractor will be allowed to work on a maximum of three sites at a time. Only three of the twenty sites are anticipated to cause any significant disruption to walkthrough access.

The map shows the approximate dates and duration of disruptive construction, but it should be noted that unforeseen underground conditions and weather delays can impact the schedule.

The purpose of this work is to create a completely separate irrigation supply system so that there is no chance of mixing recycled water with potable (drinking certified) water system. Recycled water is treated and certified for all uses except drinking. The major reason that it is not certified for drinking is that the level of salt and other minerals that remain in the water after treatment is above standards for human consumption.

For more information about recycled water, see [http://www.sanjoseca.gov/sbwr](http://www.sanjoseca.gov/sbwr)/healthandsafety.htm.

For information about the construction project, call 924-1990.

FD&O appreciates the campus’ patience as we prepare to replace about half of the campus potable water with recycled water.
