Econ. 1A. Chapter 5. **GDP and Standard of Living.**

In macroeconomics, **three statistics** - gross domestic product (GDP), the consumer price index (CPI) and the unemployment rate (UR) – **quantify the performance of the economy.** Public and private decision makers use these statistics to **monitor** changes in the economy and to **formulate** appropriate policies. Economists use these statistics to **develop** and to **test** theories about **how the economy works.** In chapters 5, 6 and 7, we will study **these three statistics** carefully.

**GDP, Income and Expenditure**

1. **Standard of living:** The **value** of goods and services that people enjoy, on **average.**
   *Income per person* determines what people can afford to buy and real GDP is a measure of real income. Thus, *real GDP per person* (i.e., real GDP divided by the population) is a commonly used measure for comparing the standard of living over time.

2. **GDP (gross domestic product):** The **market value** of all the **final goods and services** within a country during a given time period.

   a. **Final good or service:** A good or service that is produced for its final user and not as a component of another good or service.

   b. **Intermediate good or service:** A good or service that is produced by one firm, bought by another firm, and used as a component of a final good or service.

3. Calculating of GDP: Value of Production = Income = Expenditure

4. **The Circular Flow Model**
   
   **Assumptions:**
   
   (a) **Four sectors:** Households, Firms, Governments, the Rest of the World.
   
   (b) **Three markets:** Goods market, Resources market, Financial market.

   (c) A given time period.

![Circular Flow Diagram](image)

**Table:**

<table>
<thead>
<tr>
<th></th>
<th>$ billions</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>11,430</td>
</tr>
<tr>
<td>I</td>
<td>2,636</td>
</tr>
<tr>
<td>G</td>
<td>3,118</td>
</tr>
<tr>
<td>NX</td>
<td>–506</td>
</tr>
<tr>
<td>Y</td>
<td>16,668</td>
</tr>
</tbody>
</table>
5. GDP can be valued in two ways: (i) The amount that buyers pay for the goods and services: **Aggregate Expenditure** (AE), (ii) The amount it costs producers to make goods, i.e., the income (wages, interest, rent and profits) pay for resources, L, N, K, E: **Aggregate Income** (Y).

(i) \( AE = C + I + G + NX \)
(ii) \( Y = \text{wages} + \text{interest} + \text{rent} + \text{profits} \).

where \( NX = \text{export} - \text{import} = \text{net export}, \ C = \text{consumption}, \ I = \text{investment}, \ G = \text{government purchases of goods,} \ Y = \text{income}. \)

6. According to national income account principle, \( Y = C + I + G + NX \).

a. **Consumption expenditure** (C): The expenditure by households on consumption goods and services.

b. **Investment** (I): The purchase of new capital goods (tool, instruments, machines, building, and other constructions) and additions to inventories. Note that investment does not include the purchase of financial assets (e.g., Stocks and bonds).

c. **Government purchases of goods and services** (G): The expenditure by all levels of government on goods and services.

d. **Net export** (NX): the value of exports of goods and services minus the value of imports of goods and service.

**Notes:** (i) GDP does not include used goods and financial assets.
(ii) \( Y = C + S + NT \), where \( S = \text{saving}, \ NT = \text{taxes} - \text{transfer payments} \).

---

**Measuring US GDP**

7. **Expenditure Approach:** \( GDP = C + I + G + NX \)

<table>
<thead>
<tr>
<th>Item</th>
<th>Symbol</th>
<th>Amount in 2013 (second quarter) (billions of dollars)</th>
<th>Percentage of GDP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Consumption expenditure</td>
<td>C</td>
<td>11,430</td>
<td>68.6</td>
</tr>
<tr>
<td>Investment</td>
<td>I</td>
<td>2,626</td>
<td>15.8</td>
</tr>
<tr>
<td>Government expenditure</td>
<td>G</td>
<td>3,118</td>
<td>18.7</td>
</tr>
<tr>
<td>Net exports</td>
<td>NX</td>
<td>-506</td>
<td>-3.0</td>
</tr>
<tr>
<td>GDP</td>
<td>Y</td>
<td>16,668</td>
<td>100.0</td>
</tr>
</tbody>
</table>

The expenditure approach measures GDP by adding together consumption expenditure (C), investment (I), government expenditure (G), and net exports (NX).

In 2013, GDP measured by the expenditure approach was $16,668 billion.

**Source of Data:** U.S. Department of Commerce, Bureau of Economic Analysis.
8. Income approach

\[ Y = \text{compensation of employees} + (\text{interest} + \text{rent} + \text{profits}) + \text{indirect taxes less subsidies} + \text{depreciation (capital consumption)}. \]

a. Compensation of employees (wage): The payment for labor services.
b. Interest + rent + profit: This is called net operating surplus. It is the total income earned by capital (K), land (N) and entrepreneurship (E).
c. Indirect taxes: Sales taxes. Subsidies: The payments by government to firms.
d. Depreciation (capital consumption): The value of capital that results from its use.

9. Compensation of employees + (interest + rent + profits) = NDP (net domestic product at factor cost).

10. NDP + indirect taxes less subsidies + depreciation (capital consumption) = Y

11. Y + statistical discrepancy = GDP

<table>
<thead>
<tr>
<th>Item</th>

</tbody>
</table>

Source of data: U.S. Department of Commerce, Bureau of Economic Analysis.

GDP and Related Measures of production and income

Although GDP is the main measure of total production we will sometimes encounter another: Gross national product (GNP)

12. Gross national product (GNP): The market value of all the final goods and services produced anywhere in the world in a given time period by the factors of production supplied by the residents of the country. GNP = GDP + net factor income from abroad.

16. Disposable personal income = personal income received by households - personal income taxes.
GDP and Related Product and Income Measures

- **Gross domestic product (GDP)**
- **Gross national product (GNP)**
- **Net domestic product**
- **National Income**
- **Personal Income**
- **Disposable personal income**

The bars show six related product and income measures and the relationship among them.

1. **Add net factor income from abroad to GDP to get GNP.**
2. **Subtract depreciation from GNP to get net national product.**
3. **Subtract the statistical discrepancy between the expenditure and income measures (almost invisible in the figure because it is tiny) to get national income.**
4. **Add transfer payments by governments less profits retained by firms to get personal income.**
5. **Finally, subtract personal income taxes to get disposable personal income.**

**Real GDP (RGDP) and Nominal GDP (NGDP)**

17. **Nominal GDP (NGDP)** is the value of the final goods and services produced in a given year expressed in terms of the prices of that same year.
18. **Real GDP (RGDP)** is the value of the final goods and services produced in a given year expressed in terms of the prices in a base year. We will use $Y$ to indicate RGDP, i.e., $\text{RGDP} = Y$.
19. Changes in RGDP measure changes in production.
20. Changes NGDP combine changes in both production and prices.

**Example: NGDP and RGDP calculation**

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>C: T-shirts</td>
<td>10</td>
<td>4</td>
<td>$5</td>
<td>$5</td>
</tr>
<tr>
<td>I: computer chips</td>
<td>3</td>
<td>2</td>
<td>$10</td>
<td>$20</td>
</tr>
<tr>
<td>G: security services</td>
<td>1</td>
<td>6</td>
<td>$20</td>
<td>$40</td>
</tr>
</tbody>
</table>

1. **NGDP (2009)** = $\sum P Q = 5\times 10 + 10\times 3 + 20\times 1 = 50 + 30 + 20 = 100.
   **NGDP (2013)** = $\sum P’ Q’ = 5\times 4 + 20\times 2 + 40\times 6 = 20 + 40 + 240 = 300.

2. **Base Year 2009: At the price of 2009**
   **RGDP (2009)** = $\sum P Q = 5\times 10 + 10\times 3 + 20\times 1 = 50 + 30 + 20 = 100.
   **RGDP (2013)** = $\sum P Q’ = 5\times 4 + 10\times 2 + 20\times 6 = 20 + 20 + 120 = 160.

21. **GDP deflator** is an average of current prices expressed as a percentage (%) of based year prices.
   **GDP deflator** = ($\text{NGDP/ RGDP}$) x 100%

22. **Example:**

<table>
<thead>
<tr>
<th></th>
<th>NGDP</th>
<th>RGDP</th>
<th>GDP deflator</th>
</tr>
</thead>
<tbody>
<tr>
<td>2009</td>
<td>$100</td>
<td>$100</td>
<td>100.0%</td>
</tr>
<tr>
<td>2013</td>
<td>$300</td>
<td>$160</td>
<td>187.5%</td>
</tr>
</tbody>
</table>
The Uses and Limitations of RGDP

\( Y(\text{RGDP}) \) can be used to (1) compare the standard of living over time; (2) track the course of the business cycle; (3) compare the standard of living among countries.

(1) The standard of living over time

19. Real GDP per person = RGDP/population = \( Y/\text{population} \). It tells the value of goods and services that the average person can enjoy.

20. Example

<table>
<thead>
<tr>
<th>Year</th>
<th>1960</th>
<th>2013</th>
</tr>
</thead>
<tbody>
<tr>
<td>RGDP (billions)</td>
<td>$3,106</td>
<td>$15,680</td>
</tr>
<tr>
<td>Population (millions)</td>
<td>180.4</td>
<td>315.9</td>
</tr>
<tr>
<td>RGDP per person</td>
<td>$17,212</td>
<td>$49,636</td>
</tr>
</tbody>
</table>

This shows that people were 2.9 times as well off in 2013 as their grandparents had been in 1960.

21. Potential GDP (\( Y_p \)): The value of RGDP when all the economy’s factors of production – L, K, N and E – are fully employed.

(i) \( Y < Y_p \) → labor and other factors of production are unemployed.
(ii) \( Y = Y_p \) → labor and other factors of production are fully used.
(iii) \( Y > Y_p \) → labor and factors of production are over-employed.

22. \((Y/\text{population})\) and \((Y_p/\text{population})\) in U.S. 1960-2013.

Real GDP and Potential GDP Per Person in the United States: 1960–2013

Real GDP grows and fluctuates around the growth path of potential GDP. Potential GDP per person grew at an annual rate of 2.8 percent during the 1960s and slowed to 1.9 percent after 1970.

(1) RGDP per person grows and fluctuates around the growth path of potential GDP.
(2) RGDP per person growth rate from 1960 to 2009
(2) Tracking the course of the business cycle

23. Business cycle: A periodic, but irregular up-and-down movement of total production (RGDP) and other measures of economic activity. Every cycle has two phases: (1) Expansion, and (2) Recession. Every cycle also contains two turning points: (1) Peak, and (2) Trough.

---

24. **Expansion**: An expansion is a period during which Y(RGDP) increases.

**Recession**: A recession is a period during which Y(RGDP) decreases for at least two successive quarters; or defined by the NBER (National Bureau of Economic Research) as “a period of significant decline in total output, income, employment, and trade, usually lasting from 6 months to a year, and marked by contractions in many sectors of the economy.”

25. **Peak and Trough are two turning points in a business cycle**. An expansion ends at a peak, and a recession ends at a trough.

26. A recent business cycle peak was in December 2007 and the trough had been reached by June 2009. It is a 19-month recession.

---

**The Most Recent U.S. Business Cycle**

The most recent business cycle peak was in the fourth quarter of 2007 and the trough was in the second quarter of 2009 after which a new expansion began. Between the peak and the trough, the economy was in a recession. The recession was extremely deep and the expansion that followed was extremely weak—real GDP has remained a long way below potential GDP.
(3) The standard of living among countries

27. \text{RGDP per person per day} = \frac{Y}{(\text{population} \times 365)}

\begin{center}
\begin{tabular}{|c|c|}
\hline
\text{RGDP per person per day (2012).} & \\
\hline
US & $137 \\
Euro area & $93 \\
Russia & $49 \\
Latin America & Caribbean & $37 \\
Brazil & $35 \\
China & $25 \\
Middle East & $24 \\
India & $10 \\
Africa & $7 \\
\hline
\end{tabular}
\end{center}

From the data, we can see that an average American has a standard of living almost 6 times an average person in China.

\begin{center}
\begin{tabular}{|c|c|}
\hline
\text{Average income (dollars per person per day)} & \\
\hline
United States & \\
Euro area & \\
Russia & \\
Latin America & Caribbean & \\
Brazil & \\
South Africa & \\
China & \\
Middle East & \\
India & \\
Africa & \\
\hline
\end{tabular}
\end{center}

Goods and Services omitted from GDP

28. GDP measures the values of goods and services that are bought in markets. It excludes:

1. \textbf{Household production}: The production of goods and services in the home. For example, preparing meals, cutting grass, cleaning house, taking care of children and helping a child with homework.

2. \textbf{Underground production}: The production of goods and services hiding the view of government. For example, people who produce and distribute illegal drugs. Farmer work that uses illegal workers who are paid less than the minimum wages.

3. \textbf{Leisure time}: Leisure time is an economic good. But its value is difficult to measure.

4. \textbf{Environment quality}: Pollution is an economic bad. But its value is difficult to measure.

29. GDP excludes household production, underground production, leisure time and environment. However, we know they influence our standard of living. Furthermore, (1) \textit{health and life expectancy} and (2) \textit{political freedom and social justice} also influence our standard of living. But can not be quantified and exclude from GDP.

30. GDP and RGDP may not be the perfect indicator to measure our standard of living. But it is the best we have right now.
