TRAP'd Teens: Impacts of abortion provider regulations on fertility & education

Abstract: Targeted regulations of abortion providers (TRAP laws) are the fastest-growing abortion restriction in the U.S. These often result in clinic closures, limiting abortion access. We study how women's exposure to these laws in adolescence affects their fertility and educational attainment. For this study, we codify the legal history of all TRAP laws ever implemented. We explore the impacts of TRAP laws on teen births using an event-study analysis and stacked differences-in-differences. We find that impacts on births are large and robust for Black women. Black teen births in states that implemented TRAP laws increased by 3 percent relative to changes in states without these restrictions. This study documents the important role that abortion access plays in reducing the harmful economic impacts of unintended teen motherhood. The findings suggest that modern abortion restrictions are harming women's efforts at economic advancement. This work is particularly relevant given the current consideration by the U.S. Supreme Court of the state of Mississippi's plea to overturn Roe.
